

## Renegade RATMAN Track Tac Concentrate

- What does *Track Tac* compare to? **PJ1 (VHT) or LC6 (VP)**
- It appears it is priced higher than VP, Why is that? ***Track Tac* is more concentrated (up to 40 gallons out of 55 gallons of competitors product consists of IPA Isopropyl Alcohol). PJ1 compares best in formulation, but is priced much higher.**
- How do you measure it out with the Methanol or what? **It is recommended to cut *Track Tac* 50/50. An example would be: 10 gal *Trac Tac*, 10 gal methanol**
- What type tracks is it designed to be used on? **Paved Ovals or Dragstrips - asphalt or concrete**
- Why should a track make the switch to Track Tac?

**Track Tac is a premium, concentrated traction compound at a premix price that not only creates a groove, it creates good traction. These characteristics are directly related to certain properties:**

- **The first is adhesion, "how sticky it is".**
- **The second is cohesion, or the ability to resist sheer. The tire has to have a proper surface to grab onto, so "stickiness" alone is not sufficient.**

**The Renegade Track Tac's unique formulation grabs the minute particles of rubber and melds them or helps them adhere to the track surface, softens the rubber and holds it to the track. So, it's not solely the stickiness that provides the traction but its ability to allow the rubber from the tires to blend with the track, creating a "groove".**
